Smarter Access Technologies Changes the Paradigm for Leading Edge Security Solutions

Driving innovation and advantage through Microsoft Windows Embedded CE 6.0 R2 and Microsoft Silverlight

Smarter Access Technologies unveiled its newest U2Boards and U2Secure access control hardware and software platform at ISC West 2009.

The Smarter Access Technologies U2 product line is a feature rich, IT compliant, progressive technology platform designed to simplify security system installations and deliver enterprise-wide uniformity and consistency to end users in organizations of all sizes.

U2Boards includes controllers from two to six doors. The U2 product line provides the most powerful electronic security feature sets housed in the smallest hardware footprint available today. U2Boards is powered by a Microsoft Windows Embedded CE 6.0 R2 operating system for reliability, real time operation and advanced Windows technologies, easily expandable to security system “edge” devices. U2Boards installs in seconds, taking security hardware “off the wall” and out of the closet and into IT compliant data center cabinets with up to 144 card reader door ports in one 19” cabinet. The product line also includes rack mountable network ready SNMP power supplies.

The U2 family of products is designed to function as either a server based large enterprise system, or in a “host-less” environment. A common web browser powered by a Microsoft Silverlight interface enables onsite or remote system configuration and administration using the built in U2Secure access control management software.

“Smarter Access Technologies U2Boards product line is one of the most exciting advancements in distributed architecture that I’ve seen since the 1990s” said Johnny Walker, Group Program Manager, Microsoft Global Security, “It addresses the footprint, accessibility, remote management, ease of installation and even interoperability. Achieving this innovation in such a small package is fundamental to the future of our industry. It is a paradigm shifting product line.”

“Our decision to move all applications to the Microsoft suite of products proved to be a real benefit to the development cycle. Use of Microsoft Windows Embedded CE 6.0 R2 operating system, Microsoft SQL Server, and Microsoft Silverlight technologies as well as a number of key Microsoft developer tools has allowed us to position ourselves to react quickly to ever changing market needs. We are positioned to continue development of additional applications using this powerful hardware and software platform” said Isac Tabib, President of Smarter Access Technologies.

“Our use of Microsoft’s Windows Embedded CE 6.0 R2 Operating System allows us to position ourselves as a leader in the field of providing Windows based edge devices and other third party applications that will provide the most feature rich, multi-media and enhanced user experience in the industry.” Mr. Tabib noted that Smarter Access Technologies and Microsoft can now provide “end-to-end” solutions within the security industry.
